SKILLS

- **Programming Languages** : Java, Javascript
- **Libraries and Frameworks** : Spring Boot, Ruby on Rails
- **Tools** : Microservices, SQL, REST API, Kubernetes, Docker, Datadog, Kibana, GitHub, Bitbucket, MySQL, JIRA, Agentic AI

EXPERIENCE

Senior Software Engineer

May 2019 - Present

Sutherland Digital Global Pvt Ltd

Senior Backend Engineer with 7+ years of experience designing and building scalable backend systems using Java, Spring Boot, Microservices, and distributed system principles.

Experienced in developing enterprise-grade applications, REST APIs, asynchronous workflows, and third-party integrations for global clients including Airbnb, Finvi, and Citrix.

Skilled in backend architecture, AI-assisted development workflows, multi-tenant systems, production support, system optimization, and leading engineering teams. Currently upskilling in Data Structures & Algorithms, Low Level Design, and High Level System Design.

AI Productivity & Automation Initiatives

- Leveraged AI-assisted development tools including GitHub Copilot, Claude Code, and ChatGPT to accelerate software development, code reviews, debugging, documentation, and SQL query optimization.
- Designed and configured custom AI agents for architecture reviews, software development, code quality analysis, and knowledge generation to streamline engineering workflows.
- Integrated AI agents with MCP servers and enterprise platforms including Jira, Confluence, Bitbucket, Oracle Database, and Datadog to automate repetitive development and operational tasks.
- Built project-specific knowledge repositories and reusable agent skills to improve context awareness, response accuracy, and engineering productivity.
- Reduced time spent on development, code analysis, documentation, and operational workflows by approximately 20–30% through adoption of agentic AI workflows.

Airbnb – Enterprise Provisioning & Automation Platform

- Migrated legacy provisioning services from Ruby on Rails to Java-based services using Dropwizard and Zeus, improving maintainability and operational reliability.
- Integrated enterprise systems including Okta, OneLogin, Slack, Google Workspace, LDAP, and 1Password to automate provisioning and deprovisioning workflows.
- Designed and implemented scheduled offboarding and auto-deprovisioning workflows to improve security compliance and reduce manual operational effort.
- Developed notification services using Slack and email integrations to provide real-time provisioning status updates for users.
- Supported provisioning workflows for 25,000+ agents and 1,000–2,000 active users, ensuring high availability and operational reliability for enterprise onboarding processes.
- Contributed to production support (on-call), issue debugging, monitoring, and operational stability improvements.
- Debugged production issues and monitored service health using Datadog, Kibana, and centralized logging systems to ensure operational stability.
- Collaborated on deployment and release activities for containerized services running in Docker and Kubernetes-based environments.

Finvi – Multi-Tenant Debt Collection Platform (Financial Domain)

- Led 2 scrum teams consisting of 4 backend developers in building a scalable multi-tenant debt collection platform using Java, Spring Boot, and Hibernate.
- Designed and developed multiple microservices including audit history, notifications, static data management, and automated action processing services.
- Increased placement import processing capacity from 20 to 300 accounts per minute by eliminating per-account interservice API calls and implementing bulk database insert processing, reducing communication overhead and improving overall system efficiency.
- Implemented secure tenant isolation architecture to support onboarding of multiple agencies with independent data access and configurations.
- Participated in architecture discussions, production issue resolution, deployment activities, and release management.
- Mentored developers through code reviews, debugging sessions, and technical guidance to improve code quality and delivery efficiency.
- Worked extensively with SQL and MySQL databases for transaction processing, audit history tracking, and multi-tenant data management.
- Utilized GitHub and Bitbucket for source code management, pull requests, code reviews, and collaborative development workflows.

Citrix – Enterprise Workspace Integrations

- Integrated 6 enterprise applications including Outlook, Teams, Jira, ServiceNow, and Webex into Citrix Workspace using REST APIs and JavaScript.
- Implemented OAuth 2.0 authentication for single sign-on, reducing redundant logins and enhancing user experience and security.
- Analyzed and navigated complex API documentation, rate limiting, and authentication mechanisms to ensure seamless integration.
- Reduced manual re-authentication effort for users, streamlining workflow across multiple business tools.
- [Key Skills: JavaScript, REST APIs, OAuth 2.0, API Integration, Citrix Workspace]

ACHIEVEMENTS

1. Received the **Trailblazer Award** during ATMECS 10th Anniversary celebration for outstanding contributions and leadership.
2. Awarded **Certificate of Recognition** by Finvi leadership for significant engineering contributions and delivery excellence.
3. Received multiple client appreciation recognitions for technical ownership and production support excellence.
